Advanced Materials

Araldite® LY 5052 / Aradur® 5052*

COLD-CURING EPOXY SYSTEM

Araldite® LY 5052 is a low-viscosity epoxy resin
Aradur® 5052 is a mixture of polyamines

APPLICATIONS

Aerospace and industrial composites, tooling, aircraft repair

PROPERTIES

- Low viscosity, easy impregnation of reinforcement materials.
- Long pot life (2 hours for 100 ml at ambient), ample processing time allows production of big objects.
- High temperature resistance (glass transition temperature) after ambient cure: 60 °C, after post-cure at 100:120 °C.
- Excellent mechanical and dynamic properties after ambient cure with potential for even higher properties after post-cure at elevated temperatures.
- Also laminates show outstanding mechanical and dynamic properties. This system is qualified by the Luftfahrtbundesamt (German Aircraft Authority) for the production of gliders.

Adequate skin protection is indispensable.

PROCESSING

- Wet lay-up
- Resin Transfer Moulding (RTM)
- Pressure Moulding
- Filament Winding

Components	Parts by weight	Parts by volume
Araldite® LY 5052	100	100
Aradur® 5052	38	47

The components must be weighed accurately and mixed thoroughly to obtain optimal properties. The sides and bottom of mixing vessels must be included in the mixing process. Large mix quantities will show considerable exotherm, leading to short pot lives. Preferably mix smaller quantities or divide large mixes into smaller containers.

INITIAL MIX VISCOSITY (ISO 12058-1)	*[°F]*	*[cps.]*
	at 64	1150 - 1350

POT LIFE (TECAM, 100 ML, 65 % RH) LONG POTLIFE MEANS AMPLE TIME TO PRODUCE EVEN BIG OBJECTS.	*[°F]*	*[min]*
	at 64	280 - 320
	at 77	110 - 160
	at 104	45 - 55

GEL TIME (HOT PLATE)	*[°F]*	*[min]*
	at 77	420 - 500
	at 104	150 - 170
	at 104	40 - 55
	at 176	14 - 17
	at 212	4 - 6
	at 248	2 - 3

The values shown are for small amounts of pure resin/hardener mix. In practice, fiber content and laminate thickness may modify the gel time to a very significant extent. In composite structures the gel time can differ significantly from the given values depending on the fiber content and the laminate thickness.

GELATION AT 23 °C (IN THIN LAYERS: 0.4 - 0.7 MM)		*[h]*

TYPICAL CURE CYCLES	1 day 23 °C + 15 h 50 °C or 1 day 23 °C + 4 h 100 °C

The optimum cure cycle has to be determined case by case, depending on the processing and the economic requirements.
